# 

# FLEX EDUCATION SERIES Timberflex Framework Fabrication

### **OVERVIEW**

- All vertical ribs should be set slightly back from the horizontal ribs so they will not interfere in the forming of the material.
- Only attach to flush vertical rib when forming a seam.

## Let's get started!

Use traditional methods to construct the framework.

Glue, screws and staples are all suitable for construction.

To attach Timberflex the framework should consist of horizontal ribs.

### **PRO TIP:**

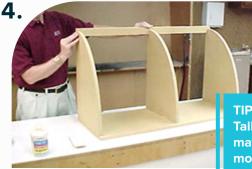

Vertical ribs are only necessary for supporting and positioning the horizontal ribs. They are not needed for attaching Timberflex.

To learn how to attach Timberflex to the framework, see our guide:

# 

FLEX EDUCATION SERIES Timberflex Framework Fabrication

TIP: Taller fixtures may require more ribs.

In most applications atleast three ribs are recommended.

Results.

**Congratulations!** Your project is complete, but this is just the beginning of opportunities with our Kerfkore products.
